                                                                                                                                                                                                                                                                                                                                                                                                                sequences AAS56729-AAS56968 represent DNA encoding BRCA-1 regulators, ribozyme target recognition RNA sequences, DNA fragments encoding the RNP and primers used in the methods of the invention. Hybridisation of ribozymes to their targets results in cleavage of the RNA target. The ribozymes can be used to cleave regulators of the tumour suppressor BRCA-1, resulting in upregulation or downregulation of BRCA-1 in a cell. The mRNA targets include those encoding the BRCA-1 regulator BRC1 inhibitor dominant negative 4 (ID4), breast basic conserved protein 1 (BBC1), GHLR2, AF6, BR2 and BR3. Regulation of BRCA-1 is useful for treating and diagnosing cancer and other proliferative disorders. The severity of an incidence of cancer can be lessened by regulating tumour proliferation through modulation of BRCA-1 expression. The sequences of the invention are useful in the development of anti-cancer drugs
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Human; BRCA-1 regulator; ribozyme; BR1; RNA target recognition; probe; cytostatic; RNA cleavage; tumour suppressor; PCR primer; CHLR2; AF6; B inhibitor dominant negative 4; breast basic conserved protein 1; BBC1; BR3; ID4; cancer; proliferative disorder; tumour proliferation; ss.

The beacon is used to detect, identify or quantify a target sequence in a sample, and to differentiate between homozygous and heterozygous polynuclectide targets. The present sequence is an F-Q HyBeacon probe targetting the a human gene for cytochrome P450, CYP2D6 which is known to contain several single nuclectide polymorphisms (SNP) and is used to demonstrate the use of the hybridisation beacons of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              A hybridization beacon which is a single stranded oligonucleotide labeled with a fluorophore is useful to discriminate between polymorphic variants

The beacon is used to detect, identify or quantify a target sequence in a sample, and to differentiate between homozygous and heterozygous polynucleotide targets. The present sequence is an P-Q HyBeacon probe targetting the a human gene for cytochrome P450, CYP2D6 which is known to contain several single nucleotide polynucleotide CNP) and is used to demonstrate the use of the hybridisation beacons of the invention in detecting the SNPs
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   A hybridization beacon which is with a fluorophore is useful to of target oligonucleotides.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to an isolated antisense oligonucleotide of 9-35 cc nucleotides in length, which specifically binds to a portion of an mRNA ceppressed from a gene encoding a mammalian betal-adrenceptor (AR) cpolypeptide and alters the translation of the mRNA nito the betal-AR cc polypeptide in a host cell expressing the mRNA. Also included are a crecombinant vector comprising the antisense oligonucleotide, and a host cell comprising the vector. A composition comprising the antisense oligonucleotide, and a host cell comprising the vector. A composition comprising the antisense in treating or ameliorating hypertension, hypertrophy and cardiac ischaemia in a mammal. A composition comprising the antisense oligonucleotide is also useful for reducing the level of betal-AR polypeptide, the cell, particularly human cell, and for decreasing blood pressure in a cmammal, where the antisense oligonucleotide is operably linked to a promoter capable of expressing the oligonucleotide in the cell. A composition comprising a selected nuclei acid segment that comprises a full-length, or is a full length betal-adrenceptor antisense collymucleotide in a cell is also useful for reducing the level of betal-AR expressing the oligonucleotide in the cell. A composition in a cell is also useful for reducing the level of betal-AR adrenceptor polymetide in a mammalian host cell. The antisense colligonucleotide is also useful for other cardiovascular diseases and cardiac dysfunction in humans. The present sequence is a betal-AR mRNA targetting antisense oligonucleotide of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Matches

                                                                                                                                                                                                                               The invention relates to a new ribozyme with the ability to inhibit replication, infectivity or gene expression of a Hepatitis C Virus (HCV) by cleaving the positive strand genomic RNA of HCV at a sequence having 16 bp. Also included are a nucleic acid encoding the ribozyme, a host cell containing the ribozyme or vector, a vector comprising a promoter operably linked to the nucleic acid, producing a ribozyme, interfering with HCV replication or gene expression in a cell infected in a cell culture with HCV or a composition comprising the ribozyme and a carrier or diluent. The ribozyme is useful for treating or preventing HCV infection. The present sequence is an HCV -ve strand recognition sequence for a ribozyme of the invention
                                                                                                                                                                                                                                                                                                                                                                                                New ribozyme having the ability to inhibit replication, infectivity or gene expression of a Hepatitis C Virus (HCV), useful for treating or preventing HCV infection.

The present invention describes a human genome-derived myosin-like protein 1 (hgDMLP-1). The protein and polynucleotide sequences of hgDMLP-1 can be used in gene therapy and vaccine production. The hgDMLP-1 curvate is used as probes to detect, characterise and quantify comproved initial substrates for the recombinant engineering of hgDMLP-1 provide initial substrates for the recombinant engineering of hgDMLP-1 comprovements, and for proved in variants having desired phenotypic improvements, and for expressing the proteins. The hgDMLP-1 proteins or polypeptides may be used as immunogens to raise antibodies that specifically recognise hgDMLP-1 proteins, as standards in assays used to determine the concentration and/or amount specifically of hgDMLP proteins, as specific biomolecule capture probes for surface-enhance laser described expecting and in vaccines or for replacement therapy. The polymucleotide sequences encoding hgDMLP-1 may be used for diagnosing a consolited with the expression of hgDMLP-1 in particular heart and skeletal muscle disorders. hgDMLP-1 is localised to chromosome 22 or he present sequence represents an oligomer used in the screening of the present invention. N.B.

The sequence data for this patent did not form part of the printed contribution in the semiplification of hgbmLP-1 wino, int/onl/hubleided not sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                 New polypeptide, for raising antibodies that recognize hGDMLP-1 proteins, or as specific biomolecule capture probes for surface-enhanced laser desorption ionization, comprises human myosin-like protein hGDMLP-1.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               21-SEP-2000;

                         The invention relates to antisense compounds targetted to a nucleic acid molecule encoding human inhibitor-kappa B-R (also known as I-kappaBR, IKBR, I-kappa-B-related, ikappab r, nuclear factor of kappa light polypeptides gene enhancer in B-cells inhibitor-like 2 and NFKBIL2) to inhibit its expression. Antisense compounds of the invention are useful for treating diseases or conditions associated with the expression of inhibitor-kappa B-R such as a heightened immune response involving increased cytokine expression, or a result of infection (e.g. bacterial, viral or parasitic). They are useful for diagnostics, therapeutics, prophylaxis e.g. to prevent or delay infection, inflammation or tumour formation, as research reagents and kits and in distinguishing between functions of various members of a biological pathway. They are also useful in antisense therapy. The present sequence is an oligonucleotide targetted to human inhibitor-kappa B-R DNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     05-NOV-2002; 2002WO-US035597.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Ś
                                                 The invention describes a compound (I) 8-50 nucleobases in length cargeted to a nucleic acid molecule (II) encoding RAIDD which is an CC targeted to a nucleic acid molecule (II) encoding RAIDD which is an CC adaptor molecule containing both death domain (DD) and caspase crecitiment domains (CARD), where (I) specifically hybridises with and CC inhibits expression of RAIDD, or specifically hybridises with at least an CC inhibiting the expression of RAIDD (Receptor interacting protein (RIP) associated ICH-1/CED-3-homologous protein with death domain) in cells or CC tissues, and for treating an animal having a disease or condition CC associated with RAIDD, where the disease or condition is a hyperproliferative disorder such as cancer, or a growth or metabolic disorder. (I) is also useful for diagnostics, therapeutics, prophylaxis, as research reagents and kits, for distinguishing functions of various anembers of a biological pathway, and in antisense gene therapy. (I) is calso useful prophylactically, e.g. to prevent or delay infection, calso useful prophylactically, e.g. to prevent or delay infection. RAIDD antisense oligonucleotide used to control expression of the RAIDD protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Query Match

The invention relates to antisense compounds targetted to a nucleic acid molecule encoding human inhibitor-kappa B-R (also known as I-kappaBR, IKBR, I-kappaB-B-related, ikappab r, nuclear factor of kappa Iijht polypeptides gene enhancer in B-cells inhibitor-like 2 and NFKBIL2) to inhibit its expression. Antisense compounds of the invention are useful for treating diseases or conditions associated with the expression of inhibitor-kappa B-R such as a heightened immune response involving increased cytokine expression, or a result of infection (e.g. bacterial, viral or parasitic). They are useful for diagnostics, therapeutics, prophylaxis e.g. to prevent or delay infection, inflammation or tumour formation, as research reagents and kits and in distinguishing between functions of various members of a biological pathway. They are also useful in antisense therapy. The present sequence is an oligonucleotide targetted to human inhibitor-kappa B-R DNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           LT 254

The invention relates to antisense compounds targetted to a nucleic acid molecule encoding human inhibitor kappa B-R (also known as I kappaBR, IKBR, I-kappa-B-related, ikappabr, nuclear factor of kappa light polypeptides gene enhancer in B-cells inhibitor-like 2 and NFKBIL2) to inhibit its expression. Antisense compounds of the invention are useful for treating diseases or conditions associated with the expression of inhibitor-kappa B-R such as a heightened immune response involving increased cytokine expression, or a result of infection (e.g. bacterial, viral or parastito.) They are useful for diagnostics, therapeutics, viral or parastic.) They are useful for diagnostics, therapeutics, prophylaxis e.g. to prevent or delay infection, inflammation or tumour
                                                                                                                                                                                                                                                                                                                                         New antisense oligonucleotides targeted to nucleic acids encoding inhibitor-kappa B-R, useful for diagnosing or treating diseases associated with expression of inhibitor-kappa B-R, e.g., a heightened immune response or infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Monia BP,

                                                                           New antisense oligonucleotides targeted to nucleic acids encoding inhibitor-kappa B-R, useful for diagnosing or treating diseases associated with expression of inhibitor-kappa B-R, e.g., a height immune response or infection.
The invention relates to antisense compounds targetted to a nucleic admolecule encoding human inhibitor-kappa B-R (also known as I-kappaBR, IKBR, I-kappa-B-related, ikappaB r, nuclear factor of kappa light polypeptides gene enhancer in B-cells inhibitor-like 2 and NFKBIL2) to

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              inhibit its expression. Antisense compounds of the invention are useful for treating diseases or conditions associated with the expression of inhibitor-kappa B-R such as a heightened immune response involving increased cytokine expression, or a result of infection (e.g. bacterial, viral or parasitic). They are useful for diagnostics, therapeutics, prophylaxis e.g. to prevent or delay infection, inflammation or tumour formation, as research reagents and kits and in distinguishing between functions of various members of a biological pathway. They are also useful in antisense therapy. The present sequence is an oligonucleotide targetted to human inhibitor-kappa B-R DNA
                                                                                                                                                                                                                                                                                                                                                                                                                                     Human; inhibitor-kappa B-R; I-kappaBR; IKBR; I-kappab r; antisense; immune response; infection; tumour; prophylaxis; phosphorothioate; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to antisense compounds targetted to a nucleic acid molecule encoding human inhibitor-kappa B-R (also known as I-kappaBR, IKBR, I-kappa-B-related, ikappab r, nuclear factor of kappa BR, polypeptides gene enhancer in B-cells inhibitor-like 2 and NFKBIL2) to inhibit its expression. Antisense compounds of the invention are useful for treating diseases or conditions associated with the expression of inhibitor-kappa B-R such as a heightened immune response involving increased cytokine expression, or a result of infection (e.g. bacterial, viral or parasitic). They are useful for diagnostics, therapeutics, prophylaxis e.g. to prevent or delay infection, inflammation or tumour formation, as research reagents and kits and in distinguishing between functions of various members of a biological pathway. They are also useful in antisense therapy. The present sequence is an oligonuclectide targetted to human inhibitor-kappa B-R DNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                     Human; inhibitor-kappa B-R; I-kappaBR; IKBR; I-kappa-B-related; ikappab r; antisense; immune response; infection; inflammation; tumour; prophylaxis; phosphorothicate; ss.

Claim 3; Page 75; 108pp; English

The invention relates to antisense compounds targetted to a nucleic acid molecule encoding human inhibitor-kappa B-R (also known as I-kappaBR, IXBR, I-kappa-B-related, ikappab r, nuclear factor of kappa BR, polypepides gene enhancer in B-cells inhibitor-like 2 and NFKBIL2) to inhibit its expression. Antisense compounds of the invention are useful for treating diseases or conditions associated with the expression of inhibitor-kappa B-R such as a heightened immune response involving increased cytokine expression, or a result of infection (e.g. bacterial, viral or parasitic). They are useful for diagnostics, therapeutics, prophylaxis e.g. to prevent or delay infection, inflammation or tumour formation, as research reagents and kits and in distinguishing between functions of various members of a biological pathway. They are also useful in antisense therapy. The present sequence is an oligonucleotide targetted to human inhibitor-kappa B-R DNA

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         inhibit its expression. Antisense compounds of the invention are useful for treating diseases or conditions associated with the expression of inhibitor-kappa B-R such as a heightened immune response involving increased cytokine expression, or a result of infection (e.g. bacterial, viral or parasitic). They are useful for diagnostics, therapeutics, prophylaxis e.g. to prevent or delay infection, inflammation or tumour formation, as research reagents and kits and in distinguishing between functions of various members of a biological pathway. They are also useful in antisense therapy. The present sequence is an oligonucleotide targetted to human inhibitor-kappa B-R DNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to antisense compounds targetted to a nucleic acid molecule encoding human inhibitor kappa B-R (also known as I-kappaBR, IKBR, I-kappa-B-related, ikappab r, nuclear factor of kappa light polypeptides gene enhancer in B-cells inhibitor-like 2 and NFKBIL2) to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New antisense oligonucleotides targeted to nucleic acids encoding inhibitor-kappa B-R, useful for diagnosing or treating diseases associated with expression of inhibitor-kappa B-R, e.g., a heightened immune response or infection.
                                                                                                                                                                                                                                                                                                                                                         Human inhibitor-kappa B-R antisense oligonucleotide, ISIS #130472.

                                                                                                                                                The invention relates to antisense compounds targetted to a nucleic acid molecule encoding human inhibitor-kappa B-R (also known as I kappaBR, CK INER, I-kappa-B-related, ikappabr, nuclear factor of kappa light polypeptides gene enhancer in B-cells inhibitor-like 2 and NFKBIL2) to inhibit its expression. Antisense compounds of the invention are useful for treating diseases or conditions associated with the expression of inhibitor-kappa B-R such as a heightened immune response involving crimcreased cytokine expression, or a result of infection (e.g. bacterial, cyiral or parasitic). They are useful for diagnostics, therapeutics, prophylaxis e.g. to prevent or delay infection, inflammation or tumour formation, as research reagents and kits and in distinguishing between functions of various members of a biological pathway. They are also useful in antisense therapy. The present sequence is an oligonucleotide crargetted to human inhibitor-kappa B-R DNA
